post and mail for mySAP™ Business Suite

ADDRESS and DATA QUALITY in mySAP Business Suite

All businesses recognize that correct, complete, up-to-date customer information is important to the success of their organization. By using post and mail, which are SAP™ Certified for integration in SAP R/3, mySAP ERP, mySAP CRM and SAP NetWeaver™, you can now ensure the quality of that data.

post and mail validate postal and delivery addresses and eliminate duplicate records within the mySAP Business Suite. These applications can improve the quality of your name and address databases as a direct user dialog or batch application, and are enterprise-wide address verification and duplicate identification tools that provide quality data feeds to the SAP database for error free customer and vendor communications.

Optimize Your Database

SAP's open application concept supports the integration of the complementary software solutions -- post and mail -- to validate and correct the addresses of prospects, customers, suppliers, and partners that are managed in SAP R/3, mySAP ERP, mySAP CRM, and SAP NetWeaver™.

post :

- Validates postal addresses within the mySAP Business Suite. SAP Certified integration assures that addresses with valid postal codes, town names, street names, and correct house numbers or PO Box numbers, are stored and managed properly in the system database. post is available for use with support for over 220 countries and is 100% Unicode-capable
- Uses various error tolerant algorithms and extensive reference tables to automatically perform the postal verification and correcting of address information. In cases of unresolved ambiguities, users are shown a dialog box that lists available valid address alternatives, from which they can select the best alternative. This application has been adapted to work with the most up to date SAP functions.

- Postal address data is always current.

mail :

- Uses error tolerant search techniques to identify, retrieve and eliminate duplicate name and address records using fuzzy logic and phonetic matching. Mail is SAP Certified for integration based on SAP standards. The system finds duplicates, even if they were stored incorrectly or if inquiries contain errors.
- Is an automated procedure, which is used prior to adding or modifying any record in the database. Users initially define the business rules for duplicate matching. Each potential duplicate record is scored based on the likelihood of being a duplicate as new records are entered.

post and mail are available as "plug & play" online components directly integrated into the Business Address Service (BAS) without any application development for mySAP CRM, mySAP Fin, mySAP ERP, SD, MM, IS-M, and IS-U, or outside BAS in custom components, Add-ons, or web IC Web client, Web-GUI, or PC UI.
